

# LIGHTWEIGHT SYMPOSIUM

7th February 2020

Luxembourg

## SAVE THE DATE

**SPACE 2020 –  
Winning  
strategies in  
innovative  
ultra-lightweight  
design**

***What we can  
learn from the  
Space Industry***

**Presentation of the Study Results  
„Space 2020 – Winning strategies in  
innovative ultra-lightweight design“**

Lightweight construction is an essential key technology that contributes significantly to the competitiveness of all European countries. It has established itself as an independent technical discipline of product development and production. Lightweight construction comprises competencies in the areas of concept, design, manufacturing, structure, material and joining technology. The service portfolio is already very multi-dimensional in the aerospace, automotive, mechanical and plant engineering, sporting goods and transport industries.

And yet it is possible to learn from astronautics – and vice versa. For this purpose, the LIGHTWEIGHT SYMPOSIUM 2020 will devote itself first and foremost to the lessons learned. As part of this unique event in a unique environment, the market and technology study „Space 2020 – Winning strategies in innovative ultra-lightweight design“ is officially presented, which was developed in close collaboration with highly qualified and renowned space companies and institutes.
